

1. Do not lay the Seed Roll over existing grass. Instead, clear the area where your new lawn will be laid, removing every last piece of vegetation from the site. Loosen the top 15-20 cm of soil with a rake and create a smooth surface free of any debris. The Seed Roll must touch the soil to grow. Do not install Seed Roll during periods of strong winds or approaching heavy rains.

Dig or rotavate to a depth of at least 15cm (20cm – 25cm is even better) and remove as much debris as possible – rubble, roots, stones etc.

ATTENTION! The area should be nutritious. Fertilise if necessary or read about the seeds that the eco cloth contains are not coated.

2. By leaving the soil for a week, any sinkage will occur before the lawn is in place, allowing it to be rectified before laying. If weeds have been prevalent in the area, wait for the first flush of weeds to germinate and remove these before laying.

It's easier to fix soil problems before your new lawn is in place. For clay soils, mix in sharp sand to aid drainage and composition. Cultivate the soil to a depth of 15cm (6") to aerate the soil and break up compaction. This creates better drainage and aids nutrient distribution. Remove any further debris which is unearthed.

3. Lightly work the surface with a rake to create a fine tilth. The flatter you can make the area, the better your lawn will look when it's laid.

ATTENTION! Water the area well overnight before planting.

4. Roll out the mat on the prepared surface. You can easily shape by cutting the canvas with ordinary scissors.

5. Wrap the planting cloth with approx. 3-5 cm in the joints. Grass will only grow where the cloth covers the soil.

Cover a little with soil between 0.5 to 1 cm maximum so that nutrients bind better and the soil retains moisture more easily.

ATTENTION! Do not cover with more than 1 cm of soil.

6. Once positioned, water frequently: 2/3 times a day until saturated each time. **DO NOT** apply a strong stream of water to the product. Keep the product constantly moist for the first three weeks.

Grass seed requires warmth, light and moisture to germinate. If the conditions are too dry in the first 2 weeks the seeds can die.

ATTENTION! Keep the surface moist until the grass has become about 5 cm high.

7. Create the perfect lawn. Within a few weeks, you will have a lush, green and beautiful lawn.
