

EASYVENT INSTALLATION GUIDE

Step 1

Calculate how many EasyVents are needed (one EasyVent for every five square metres of ceiling area)

Step 2

Before you fit EasyVents, decide where you will gain maximum cross ventilation,. Mark the chosen areas with chalk and separate the overlaying felt (this is easily done by inserting your fingers between the felt). Always wear protective clothing i.e. gloves and a breathing respirator when carrying out this operation.

Step 3

Remove the EasyVent from the packaging and insert the compression spring into the location slot, this is found between the inner surfaces of the vent. Holding the EasyVent in both hands, compress the vent and insert between the two surfaces of the felt, and then release.
