

BIOHUMUS - ORGANIC FERTILIZER FOR POT PLANTS -NATURA

- a completely natural fertilizer, intended for the fertilization of all plants grown in pots
- ensures the proper condition and health of potted plants
- improves the quality of the soil due to the content of active humus
- made on the basis of vermicompost - a product of Californian earthworms

Contains

nitrogen (N) - 0.09%

phosphorus (P₂O₅) - 0.06%

potassium (K₂O) - 0.12%

Biohumus fertilizer for potted plants is a liquid organic fertilizer. Intended for use in the cultivation of ornamental potted plants, both ornamental from leaves and flowers. The fertilizer is made of natural ingredients derived from vermicompost - a product of Californian earthworms.

Plants grown in pots are particularly at risk of losing many of their nutrients. Most of them are quickly absorbed by plants from the ground, and some of them are rinsed out during watering. Therefore, it is very important to systematically replenish the nutrients in the substrate, which remains unchanged throughout most of the plant vegetation. The balanced composition of the fertilizer causes the plants to have high health, grow vigorously and bloom intensively. Biohumus fertilizer for potted plants used systematically replenishes nitrogen, phosphorus and potassium deficiencies. The content of humus compounds in the fertilizer regenerates the substrate. Biohumus for potted plants can be used throughout the season.

Application method

Dilute 60-120 ml (2-4 caps) of fertilizer in 1 liter of water. In the period from February to September, the plants should be fertilized with each watering. In the period from October to January, fertilize plants every 1-2 weeks, because indoor plants need less nutrients during winter dormancy.

Available packages: 1 L.
